mouthrinses with 0.1% or 0.2%, chlorhexidine (CHX) in children, for 6 months, achieved significant reductions for plaque and gingival indices, and no differences for caries increment, compared with a placebo (Lang et al. 1982).

Mechanical and chemical plaque control in the simultaneous ...

Plaque removal (plaque control) is the most important measure for prevention of caries and gingivitis. Since mechanical removal of plaque is not adequate, chemical agents must also be used. Fluoride, for example, effectively inhibits plaque metabolism. The efficacy of enzymes, alkaloids, and antiseptics is limited.

How to remove plaque and tartar: Best home treatments

The principle routes to chemical plaque control are to prevent colonization of the tooth surface, to inhibit the growth of microorganisms, to prevent plaque maturation, to modify plaque biochemistry and to modify plaque ecology to a less pathogenic flora.

Routes to chemical plaque control: Biofouling: Vol 4, No 1-3

Years of documented research have established that chlorhexidine digluconate is safe, stable, and, owing to its great substantivity, effective in preventing and controlling plaque formation, breaking up existing plaque, and inhibiting and reducing the development of gingivitis.
